

# Pedestrian Bridge Relocation Project

Memorial Park  
Antrim, NH

QCC recently completed the design for removal and relocation of a prefabricated steel pedestrian bridge salvaged from the West Street Bridge Replacement Project in Antrim, NH. The pedestrian bridge will be relocated to Memorial Park and will replace an existing wooden pedestrian bridge. The bridge will provide pedestrian access over Great Brook from Memorial Park to Main Street.

The Pedestrian Bridge Relocation Project included site evaluation at Memorial Park for access, crane setting requirements, hydraulic evaluation of Great Brook and site design to set the salvaged bridge above the 100-year flood level. Reinforced concrete abutments were designed to accommodate the configuration of the existing steel bridge bearing seats. Approach ramp profiles were developed for ADA accessibility.

The Pedestrian Bridge Relocation Project will be constructed in 2019 utilizing Town Funds.
